Fernando López Trejo

Frontend Engineer | React / TypeScript

Target roles: Senior Frontend Engineer / Senior Frontend React / TypeScript

[email] | [phone] | [city, Spain] | [LinkedIn] | [GitHub / portfolio]

PROFESSIONAL PROFILE

Frontend Engineer focused on building maintainable web products with React and TypeScript, with experience across API integration, data flows, product interfaces and end-to-end technical problem solving. I have worked on hotel budgeting solutions, offline time tracking and Nivichat, an RAG-based search and answer MVP already in use with Nivimu's general wiki. I focus on turning complex requirements into clear, robust and evolvable user experiences.

CORE STRENGTHS

React and TypeScript	Frontend architecture and integration	APIs and data contracts
Async flows and streaming	RAG and document search	Quality, testing and debugging

EXPERIENCE AND TECHNICAL RESPONSIBILITIES

The available materials do not include employer names or dates. Complete those fields before sending this CV. The entries below describe documented work and projects without presenting training as employment.

Frontend Engineer / Technical Contributor

[Company or product] | [start month/year - end month/year or Present] | [location / remote]

- Developed and evolved web interfaces with a focus on React and TypeScript, connected to real product services and business flows.
- Contributed to frontend technical decisions: separation of concerns, integration contracts, loading and error states, and maintainability.
- Worked on hotel budgeting, offline time tracking and Nivichat features, adapting the experience to product needs and technical constraints.
- Collaborated on issue diagnosis and software quality through testing, technical review and documentation.

Nivichat / Nivi - RAG MVP in use

Professional project | Status: MVP in use; second phase in development

- Contributed to the frontend solution and integration with a Nivi microservice that turns authenticated questions into grounded answers through RAG and SSE streaming.
- The current MVP uses Nivimu's general wiki. The second phase lets each client select from the frontend which documents should be used as references.
- Integrated the flow with the backend so document references reach the service, which extracts text, vectorizes it and maintains a client-identified collection for customized answers.
- Worked with authentication and authorization contracts, vector and lexical retrieval, PDF/HTTP source reconstruction and OpenAI-compatible responses.

SELECTED PROJECTS

Hotel budgeting and CP-SAT

Contributed to a hotel budgeting solution and to constraint modeling with CP-SAT, connecting domain complexity with an understandable user experience.

Offline time tracking

Frontend work on an offline time-tracking flow, with attention to local capture, connectivity recovery and later synchronization under the product contracts.

Nivi microservice

TypeScript microservice using Fastify, LangGraph, Qdrant and LiteLLM; JWT authentication, client and role authorization, combined retrieval, PDF extraction and SSE streaming.

TECHNICAL SKILLS

React | TypeScript | JavaScript | HTML | CSS | REST APIs | frontend integration | Fastify | LangGraph | Qdrant | LiteLLM | RAG | embeddings | JWT | SSE | PDF extraction | testing | debugging | technical documentation | constraint-based and offline flows

EDUCATION

- [Degree / studies] - [Institution] - [year or period]

- OXYGEN - Training programme - [institution / edition / period if applicable]

LANGUAGES AND AVAILABILITY

- [Language] - [level]

- Availability: [complete]

- Location / working model: [complete]

Note: replace every bracketed field before sending.
